# **The Crushing Truth About Compression**

Sarah Jacobs, B.S. R.T.(R)(M)(CT)

Breast Imaging Consultant, Mammography Educators

#### **Objectives**

- Identify the goal of compression during mammographic exams and why it's so important
- Distinguish when and how compression should be applied
- Recognize common challenges that may prevent the application of adequate compression
- Use communication tools to aid in achieving adequate compression

Mammography Technologists

- · Creatures of habit
- Scripts are familiar
- · Live and breathe patient care
- · Understand our role is personal

com pres sion /kəm preSHən/

1. The act of compressing or being compressed a. The reduction in volume

5

Compression **Mammography** 

taut

/tôt/

#### Compression in Mammography

- · Pulls breast away from chest wall
- · Minimizes motion
- · Creates more uniform thickness
- · Reduces scatter
- Spreads out overlapping tissues
- Reduces radiation dose to the patient
- Increases contrast of the image

#### What's Required?

According to the 1999 ACR Manual, ideal compression should be based upon 2 factors:

- 1. The maximum amount an individual patient's breast can actually be compressed
- 2. The amount of compression that the patient can tolerate during the exam

6

"Ideally the breast should be compressed until the tissue is taut: gentle tapping will not indent the skin when breast compression is taut. At a maximum, compression should be less than painful."

8

### European Journal of Radiology December, 2014

"According to researchers, the lack of consistent guidelines regarding mammographic compression has led to wide variation in it's technical execution."

#### NCBI November, 2017

"While it is widely accepted that firm breast compression is needed to ensure acceptable image quality, guidelines remain vague about how much compression should be applied during mammogram acquisition."

10

## A lack of standardization in compression guidelines results in:

- · Decreased reproducibility in imaging
- Increased risk of unnecessary pain
- · Inadequate image quality

11

14

12

15

- I. Lack of consistent compression guidelines
- Inadequate image quality, higher recall rates and unnecessary pain for patients
- Properly applied compression is neglected, even though it's an extremely important factor that affects image quality

13

RECAP

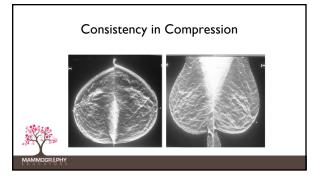

3. We know that how much technologists should be compressing the breast should be a combination of:

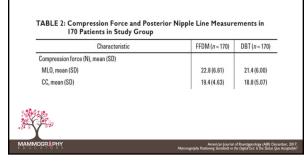

• How much TECHS can actually reduce the breast's volume

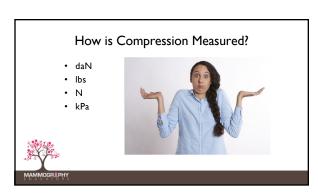

• How much the PATIENT can actually tolerate

4. Techs should compress until the breast is "taut" or less than painful

34 35 36

Over-compression occurs less frequently in the United States, where under-compression, or extremely low applied pressure, is more common.

#### How and When Should Compression Be Applied

- Ensure your patient is ready
- · Compression paddle should take the place of your hand during positioning
- · Apply at a speed that ensures your patient is comfortable
- · Use a combination of the foot pedal and the manual hand
- Override automatic compression release when necessary

38

Compression Testing Quality Control Tests • Medical Physicist Tests

39

#### When to Call for Service

Problems with compression testing and results.

40

"I wish there was a better way..." Great news! We're getting there!

41

#### **Progress**

The FDA has cleared for U.S. marketing many devices, accessories, or features which may lessen the discomfort of breast compression.

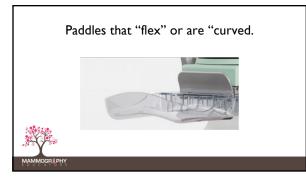

42

#### **Progress**

- · These include a cushion for the breast on the surface of the mammography unit
- · Compression paddles with fixed or dynamic tilt that distribute compression across the front and back of the
- A curved compression paddle to fit some breast contours

A compression paddle control device used by the patient

Providing comfort during an exam that's "less than comfortable".

43 45

#### Paddles that Determine Adequate Compression

- · European-based company
- Paddle is based on the concept of optimized breast compression based on each individual breast

#### Patient-Assisted Compression (PAC)

- Patient-Assisted compression doesn't impair mammographic quality.
- Patient-Assisted compression increases breast compression and lowers dose
- · Anxiety linked to mammography may be reduced
- Many patients reported overall satisfaction

Patient Assisted Compression (PAC)

"Seventy-four percent of patients reported that the selfcompressing device would facilitate their reattendance" -European Journal of Cancer, 2018

"52.8% declared they were less anxious compared to previous examinations" -European Journal of Breast Health, 2019

#### It's all about CONTROL

- · Patients need to feel as though they are active participants
- · This helps to reduce anxiety and fear associated with their mammogram

49

50

#### How to Obtain Better Compression

- · Establish a rapport and connection with the patient to
- Educate the patient on what to expect and ensure her that she's in control
- Explain how long compression may last

#### The "Un-Compressibles"

- · Explain that an under-compressed breast doesn't produce the quality needed
- · Explain that subtle changes in the breast are difficult to see without proper compression
- · Offer to have your patient auto compress
- Offer to reschedule at a time when the patient's breasts are less tender

51

#### The "Un-Compressibles"

If you have virtually no compression:

- Tell the patient that you cannot submit images that are not of diagnostic value
- · Offer to refer the patient to their physician in order to discuss alternative options for breast screening

#### Compression and Communication

- Use analogies
- Choose your words wisely:
- "Detect Changes" vs. "Detect Cancer"

#### **Building Confidence through Communication**

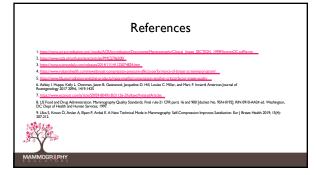

- · Allow the patient to play a part in the imaging process
- · Reassure the patient
- Tell them they're doing a "great job"
- · Remember anxiety clouds intake
- · Look for non-verbal communication cues
